

This one is going to be shorter since there isn't that much more to talk about. mongoDB feels a bit more modern than Mysql. Mysql feels a bit dated but I think I do prefer a relational database over mongoDB. Having the restrictions hard coded in makes me feel way more confident about my database. I know the first time I ran it, my code was wrong so I ended up with 500 patron types that were all identical that would not have happened in a database with foreign keys already built in. The flexibility of the database is nice. It feels like the user is more in control of how they want it to flow and it is really up to them to define those restrictions if implement them at all.

Some differences in execution, there is 1 extra library code for null with that being how the implementation works

Execution was done in this one in 931.69 seconds (15 minutes)
